Secure client access with Kerberos. 1

Secure client access with Kerberos

Enable Kerberos to secure storage access for NAS clients.

This procedure configures Kerberos on an existing storage VM enabled for [NFS](#) or [SMB](#). It is assumed that you have already configured DNS, NTP, and [LDAP](#) on the storage system.

Steps

1. At the ONTAP command line, set UNIX permissions for the storage VM root volume.
 - a. Display the relevant permissions on the storage VM root volume: `volume show -volume root_vol_name-fields user,group,unix-permissions`

The root volume of the storage VM must have the following configuration:

Name...	Setting...
UID	root or ID 0
GID	root or ID 0
UNIX permissions	755

- b. If these values are not shown, use the `volume modify` command to update them.
2. Set user permissions for the storage VM root volume.
 - a. Display the local UNIX users: `vserver services name-service unix-user show -vserver vserver_name`

The storage VM should have the following UNIX users configured:

User name	User ID	Primary group ID
nfs	500	0
root	0	0

Note: The NFS user is not required if a Kerberos-UNIX name mapping exists for the SPN of the NFS client user; see step 5.

- b. If these values are not shown, use the `vserver services name-service unix-user modify` command to update them.
3. Set group permissions for the storage VM root volume.
 - a. Display the local UNIX groups: `vserver services name-service unix-group show -vserver vserver_name`

The storage VM should have the following UNIX groups configured:

Group name	Group ID
daemon	1
root	0

- b. If these values are not shown, use the `vserver services name-service unix-group modify` command to update them.
4. Switch to System Manager and configure Kerberos: click **Storage** > **Storage VMs**, select the storage VM, click **Settings**, click  under Kerberos, click **Add** under Kerberos Realm, and complete the following sections:
 - a. Add Kerberos Realm: enter configuration details depending on KDC vendor.
 - b. Add Network Interface to Realm: click **Add** and select a network interface.
5. If desired, add mappings from Kerberos principal names to local user names.
 - a. Click **Storage** > **Storage VMs**, select the storage VM, click **Settings**, and then click  under **Name Mapping**.
 - b. Under **Kerberos to UNIX**, add patterns and replacements using regular expressions.
